

Ali Alzarra  
CCII -- AR  
4/20/2020

I really enjoyed the Augmented reality experience. I noticed some applications did a really good job tracking the surface while others were that good. That's made me think if coding is part of this experience. If i'm going to use the same hardware would the software developing lead to a better experience.

In the first place a technology like this meant to make us experience a different angle of our thoughts. AR is a really great experience and I can see it in the future. The only problem it faces right now is that we need a device to show us the AR. if we can develop glasses or a contact lens that can project the AR on it. That will open a different horizon of technology.
